WIRELESS NOTICE BOARD USING GSM900A

The **Wireless Notice Board using GSM** is a smart display system that allows messages to be updated remotely using a mobile phone. A GSM module (SIM900A) receives SMS messages sent from any authorized number. The Arduino processes the received message and displays it on the LCD notice board. This system eliminates the need for manual updates, saves time, and enables instant communication. It is useful in schools, colleges, offices, and public places for broadcasting important announcements wirelessly.

BEFORE RECEIVING THE MESSAGE
